LEATHER, TANNED AND CURRIED.

[For purposes of comparison, this table includes for 1880, 2,319 establishments reported as "Leather curried" and 3,105 as "Leather tanned". At the Tenth Census an establishment engaged in both tanning and currying made a separate report for each branch of the industry and was counted twice. In 1890 but one report was received for each establishment.]

MOTIVE POWER USED IN MANUFACTURES.

MOTIVE POWER USED IN MANUFACTURES.

Of the 355,415 establishments reporting at the Eleventh Census as engaged in manufacturing or mechanical industries, 100,735, or 28.34 per cent, report the use of motive power other than human or animal. At the census of 1880, 85,923 establishments, or 33.85 per cent of the total number, reported the use of power. The decrease in the percentage of establishments reporting the use of power is accounted for by the more thorough canvass in 1890 of the mechanical trades and the inclusion of certain industries, such as dressmaking and china decorating, that were omitted in 1880 and that do not use power to any extent.

The number of establishments reporting the use of power increased 14,812, or 17.24 per cent, during the 10 years from 1880 to 1890, while the total horse power increased from 3,410,837 to 5,954,655, or 74.58 per cent, as compared with an increase of 1,064,695 horse power, or 45.38 per cent, during the decade from 1870 to 1880. The average horse power per establishment for the establishments reporting the use of power increased from 39.70 horse power in 1880 to 59.11 horse power in 1890. During the same period the average horse power per engine increased from 38.69 to 50.12 and the average horse power per water wheel from 22.12 to 32.18. The average horse power per engine and that per water wheel are considerably reduced by the more general and extensive use of small engines and small hydraulic motors.

The increase in the total horse power and in steam and water horse power, respectively, in the different states and principal industries during the 20 years from 1870 to 1890 is shown in Tables 1 and 2. A comparison of the horse power reported at the different censuses can not be considered as an exact indication of the increase. Some industries that report the use of considerable power, such as quartz milled, and the manufacture of sugar on plantations, were included in the statistics of manufactures in 1870, but were assigned to other branches of the census inquiry in the reports for subsequent years. Bottling, cars and general shop construction and repairs by steam railroad companies, and gas manufacture were included in the report on manufactures for 1870, omitted in 1880, and again included in 1890. Cotton ginning was also included in 1890, but was not reported at the census of 1870 or that of 1880. It was found impracticable at the census of 1890 to make a canvass of the entire United States for the collection of statistics pertaining to the generation of electricity for lighting and power purposes, and the data for this industry are confined to the state of New York, the city of St. Louis, Mo., and the District of Columbia.

In certain industries in some states no establishments reported the use of power, while establishments engaged in the same industries in other states did report the use of power; the industry, therefore, is omitted from the total of the state in which no power is reported. In other industries, such as dressmaking, no establishments reported the use of power, and in such cases the entire industry is omitted.

A small percentage of the establishments reported at each census as engaged in industries in which power is of a necessity used failed to make reply to these questions. Therefore, while the totals may be accepted as a fair statement of the actual horse power used in the principal industries reported at the respective censuses, the comparison of the totals for all industries must be considered as only approximate. All of the establishments included in a general class, such as "Lumber and other mill products from logs or bolts", do not of necessity use power. This class of industry, for instance, includes not only lumber mills and saw mills but the manufacture of cooperage and basket and chair stock, shingles, and various other articles in the production of which power may or may not be used.

The returns for power used in "Cotton compressing" at the census of 1890 were very incomplete and the data reported have been excluded from the totals for that census. The power used in this industry and in "Hay and straw baling" may be considered as distinct from the motive power used in the running of machines, and the totals for the two industries in the different states are shown separately in the statement following.

In addition to the steam and water power, the accompanying tables show for 1890 motive power under the heads of "Electricity", "Gas", "Rented power", and power "Not specified". A large proportion of the "Electricity" and "Gas" power and power "Not specified" is rented, but as it was impossible to ascertain the exact amount, it is not shown separately.

The manufacture of salt, especially in the state of Michigan, is conducted largely in connection with the manufacture of lumber, and in many cases the steam used in the salt works is supplied from the boilers of the saw mill. A similar duplication occurs in cotton ginning and in other industries when the different industries are carried on in the same or adjoining buildings. A duplication in the amount of horse power reported as rented occurs when the establishment from which the power is rented is engaged in manufacturing and has made a return as such. It is impossible to ascertain the exact amount of such duplication, and the data have been tabulated and are presented for the respective industries as reported. The following statements show the amount of power duplicated in the accompanying tables, so far as it can be ascertained:

The great increase in power used in manufactures is due almost entirely to the increase in steam power. The total amount of power increased 3,608,513 horse power, or 153.81 per cent, during the 20 years from 1870 to 1890. Of this increase steam power formed 3,446,318 horse power, increasing 283.48 per cent, while the water power increased 132,912 horse power, or 11.76 per cent. The remainder of the total increase in horse power is 29,283, comprising 15,569 electric power, 8,930 gas power, and 4,784 unspecified power, none of which were reported in the census of 1870. In the decade from 1880 to 1890 the steam horse power more than doubled, and the water horse power increased only 3.10 per cent.

The percentage that the total horse power reported for each state is of the total for the United States, also the percentage that the steam and water power, respectively, in each state is of the total horse power reported for the state at the censuses of 1870, 1880, and 1890, are shown in the following statement:

The preceding statement indicates the relative importance of the different states and territories in the total horse power used in manufactures, and the displacement of water by steam power in each state and territory. The distribution of the total horse power and the relative importance of steam and water power in the different geographical divisions, and in some of the principal industries at the censuses of 1880 and 1890, are shown by the two statements that follow. These statements give for each geographical division and for each industry, respectively, the total horse power reported and the relative amount of steam and water power.

The gradual distribution of motive power among all classes of manufactures and in all sections of the country is indicated by the two preceding statements. While the relative amount of power controlled by the manufacturers in the geographical divisions that report the largest amount of power in 1880 has decreased, a corresponding increase is shown for those divisions in which the use of motive power was not carried to such a degree. The per cent of the total horse power reported by the principal industries decreased during the 10 years from 1880 to 1890 in almost every instance.

The number of establishments reporting the use of power is not shown for the census of 1870. The following statement, however, gives the average horse power per establishment for some of the principal industries reported at the censuses of 1880 and 1890:

AVERAGE HORSE POWER PER ESTABLISHMENT: 1880 AND 1890.

The average horse power per employé in the principal industries is shown by the following statement, as obtained from the total horse power and the total of the average number of employés reported for the respective industries at the census of 1890. The number of employés used as a divisor does not include officers, firm members, or clerks.

The classification of the reports of establishments engaged in mechanical and manufacturing industries at the census of 1890 was controlled by the product of chief value. Therefore, the report of an establishment engaged in the manufacture of iron and steel and continuing the manipulation of the metal until a more highly finished product, such as nails, spikes, bolts, or rivets, was produced, would be assigned to the classification covering its finished product.

The horse power reported by all establishments engaged in the manufacture of iron and steel by means of blast furnaces, rolling mills, and steel works or forges and bloomeries, irrespective of the form of the finished product, amounted to 784,358 horse power during the census year 1890; in addition there was reported 41,368 horse power represented by engines that were idle during the year, making a total of 825,726 horse power as compared with 433,159 in 1880, being an increase of 392,567 horse power, or 90.63 per cent. During the same period the proportional amount of horse power reported as idle decreased from 8.29 to 5.01 per cent. From 1870 to 1890 the total horse power reported for the industry increased 655,051 horse power, or 383.80 per cent, and the average horse power per establishment increased from 211 to 985 horse power, or 466.82 per cent. The displacement of water power by steam power in the manufacture of iron and steel is indicated by the fact that in 1870 steam formed 90.28 and water 9.72 per cent of the total active power, while in 1890 steam formed 98.59 and water 1.41 per cent of the total.

The average tonnage of product per horse power for all branches of the industry decreased from 21.4 in 1870 to 18.2 in 1880, and increased to 23.2 in 1890. The average tonnage of product per employé increased from 47.1 in 1870 to 51.6 in 1880, and 106.4 in 1890, and the average horse power per employé from 2.2 in 1870 to 2.8 in 1880 and 4.6 in 1890.

The statistics concerning horse power reported for the different classes of establishments engaged in the manufacture of iron and steel are shown in detail in the special report on "Iron and steel" in Part III of the report on Manufactures for the Eleventh Census.

TABULAR STATEMENTS.

Tables 1 and 2 present in comparison the total horse power, the total steam horse power, and the total water horse power reported at the censuses of 1870, 1880, and 1890, for the different states and territories and selected industries, respectively.

Tables 3, 4, 5, and 6 give in detail the horse power as reported at the census of 1890; No. 3 presents the data by totals of states and territories; No. 4, by totals of specified industries; No. 5 gives the total for each specified industry in each state and territory, and No. 6 shows the contribution of the total of each state and territory to the total for each specified industry.
